

Mergerware assessment:

There is some problem with meteor installation so I implemented using javascript.

Tech stack used: html, css, javascript.

Functionalities:

Assumption: There is only one admin username: 'pr' , password= '8888'.

- Admin can deposit money to his account once he is paid with money physically.
- Admin can send this money to other accounts.
- Other members can send money among themselves and the admin.
- Once the member wants cash then he can approach the bank transfer the amount to admin's account. After transaction admin will delivery cash to him/her.
- If members wants to close the account. They can do that using the close account option.
- The account will be logged out after when the user is inactive for 2 minutes.
- Only the First char of user first and last name is used as username for simplicity.
